

3. TRUE or FALSE. (If true, PROVE it. If false, give a COUNTER EXAMPLE.)

If every proper subgroup H of a group G is abelian, then G is abelian.

False The group S_3 has 6 elements and is not abelian.
 Lagrange's Theorem tells us that the ^{proper} subgroups
 of S_3 have order 1, 2, 3; hence Lagrange's Theorem also
 tells us that these subgroups are cyclic; hence
 abelian

4. TRUE or FALSE. (If true, PROVE it. If false, give a COUNTER EXAMPLE.)

If H is the set of odd permutations in S_5 , then H is a group.

False (12) is an odd permutation in S_5
 but $(12)(12)$ is not an odd permutation.
 so ~~H~~ is not closed. It is not a group
