$$C(q) = 7q + 24000.$$

- The \$24,000 expenditure is called a *fixed cost*.
- The \$7/radio in labour and material is called a *variable cost*.

LINEAR MARGINAL COST

MATH 122

CLIFTON

1.4: APPLICATIONS OF FUNCTIONS TO ECONOMICS

1.5: EXPONENTIAL FUNCTIONS

1.6: LOGARITHMS

INVERSE FUNCTIONS

DEFINITION

EXPONENTIAL FUNCTIONS WITH BASE e

DEFINITION 1

For a linear cost function, the marginal cost is the cost to product one additional unit:

$$\frac{C(q+1) - C(q)}{(q+1) - q} = C(q+1) - C(q).$$

LINEAR MARGINAL COST

MATH 122

CLIFTON

1.4: APPLICATIONS OF FUNCTIONS TO ECONOMICS

1.5: EXPONENTIAL FUNCTIONS

1.6: LOGARITHMS

INVERSE FUNCTIONS
DEFINITION

EXPONENTIAL
FUNCTIONS WITH
BASE e

DEFINITION 1

For a linear cost function, the marginal cost is the cost to product one additional unit:

$$\frac{C(q+1) - C(q)}{(q+1) - q} = C(q+1) - C(q).$$

REMARK 1

This is just the slope of the linear cost function.

TO
ECONOMICS

1.5: EXPONENTIAL
FUNCTIONS

1.6:
LOGARITHMS

INVERSE FUNCTIONS

DEFINITION

EXPONENTIAL
FUNCTIONS WITH
BASE e

In the example above, assume that radios sell for 15 each.
The revenue function is

$$R(q) = 15q.$$

The profit function is

$$\pi(q) = R(q) - C(q) = 15q - (7q + 24000)$$

EXAMPLE

MATH 122

CLIFTON

1.4: APPLICATIONS OF
FUNCTIONS
TO
ECONOMICS

1.5: EXPONENTIAL
FUNCTIONS

1.6:
LOGARITHMS

INVERSE FUNCTIONS

DEFINITION

EXPONENTIAL
FUNCTIONS WITH
BASE e

In the example above, assume that radios sell for 15 each.
The revenue function is

$$R(q) = 15q.$$

The profit function is

$$\pi(q) = R(q) - C(q) = 15q - (7q + 24000) = 8q - 24000.$$

EXAMPLE

MATH 122

CLIFTON

1.4: APPLICATIONS OF
FUNCTIONS
TO
ECONOMICS

1.5: EXPONENTIAL
FUNCTIONS

1.6: LOGARITHMS

INVERSE FUNCTIONS
DEFINITION

EXPONENTIAL
FUNCTIONS WITH
BASE e

In the example above, assume that radios sell for 15 each.
The revenue function is

$$R(q) = 15q.$$

The profit function is

$$\pi(q) = R(q) - C(q) = 15q - (7q + 24000) = 8q - 24000.$$

The break-even point is value of q making

$$8q - 24000 = 0$$

hold.

EXAMPLE

MATH 122

CLIFTON

1.4: APPLICATIONS OF FUNCTIONS TO ECONOMICS

1.5: EXPONENTIAL FUNCTIONS

1.6: LOGARITHMS

INVERSE FUNCTIONS
DEFINITION

EXPONENTIAL
FUNCTIONS WITH
BASE e

In the example above, assume that radios sell for 15 each.
The revenue function is

$$R(q) = 15q.$$

The profit function is

$$\pi(q) = R(q) - C(q) = 15q - (7q + 24000) = 8q - 24000.$$

The break-even point is value of q making

$$8q - 24000 = 0$$

hold. Therefore the break-even point is

$$q = \frac{24000}{8} = 3000.$$

FUNCTIONS WITH
BASE e

In 1995, there were 14 wolves reintroduced to Wyoming. By 2012 (17 years later), there were 207 wolves. Assuming the growth of the population is exponential, find a function $P(t)$ modeling the population size as a function of t years after 1995.

$$\begin{aligned}P(17) &= P(0) \cdot a^{17} = 14a^{17} = 207 \\ \Rightarrow a^{17} &= \frac{207}{14} \\ \Rightarrow a &= \sqrt[17]{\frac{207}{14}} \approx 1.172\end{aligned}$$

INVERSE FUNCTIONS
DEFINITION

EXPONENTIAL
FUNCTIONS WITH
BASE e

In 1995, there were 14 wolves reintroduced to Wyoming. By 2012 (17 years later), there were 207 wolves. Assuming the growth of the population is exponential, find a function $P(t)$ modeling the population size as a function of t years after 1995.

$$\begin{aligned}P(17) &= P(0) \cdot a^{17} = 14a^{17} = 207 \\ \Rightarrow a^{17} &= \frac{207}{14} \\ \Rightarrow a &= \sqrt[17]{\frac{207}{14}} \approx 1.172\end{aligned}$$

Therefore,

$$P(t) = 14 \left(\frac{207}{14} \right)^{\frac{t}{17}} \approx 14(1.172)^t.$$
