Helpful Overleaf Feature. If you left double click at a place in the PDF file, then Overleaf indicates the corresponding place in the LaTeX file, making it easy to compare the PDF output to LaTex input.

## How to write a proof.

Basically, we start our proof with $\backslash$ begin $\{$ proof $\}$ and end our proof with $\backslash$ end $\{$ proof $\}$. Then just put our proof between the $\backslash$ begin $\{$ proof $\}$ and $\backslash$ end\{proof $\}$. That's all. Recall in LaTex as soon as we write $\backslash$ begin $\{$ proof $\}$, in order to compile we need to include the $\backslash$ end\{proof $\}$ below the $\backslash$ begin\{proof\}, In LaTex, whenever we begin something, we need to end that something before compiling. The below example is a slight modification to the proof of Theorem 1.8 on page 22.

Lemma POO. The product of two odd integers is an odd integer.
Proof. Let $x$ and $y$ be odd integers. We will show that $x \cdot y$ is an odd integer.
Since $x$ and $y$ are odd integers, by definition of odd integer, there exist $k_{x}, k_{y} \in \mathbb{Z}$ such that

$$
\begin{equation*}
x=2 k_{x}+1 \quad \text { and } \quad y=2 k_{y}+1 . \tag{1}
\end{equation*}
$$

By (1) and then algebra,

$$
\begin{align*}
x \cdot y & =\left(2 k_{x}+1\right)\left(2 k_{y}+1\right) \\
& =4 k_{x} k_{y}+2 k_{x}+2 k_{y}+1 \\
& =2\left(2 k_{x} k_{y}+k_{x}+k_{y}\right)+1  \tag{2}\\
& =2 q+1
\end{align*}
$$

where $q=2 k_{x} k_{y}+k_{x}+k_{y}$. Note $q \in \mathbb{Z}$ since $2, k_{x}, k_{y} \in \mathbb{Z}$ and the integers are closed under multiplication and addition. We have just shown

$$
\begin{equation*}
x \cdot y=2 q+1 \text { for some } q \in \mathbb{Z} \tag{3}
\end{equation*}
$$

Thus equation (3) shows that $x \cdot y$ is an odd integer by the definition of odd integer.
We have just shown that the product of two odd integers is an odd integer.
BTW. Below is a Know-Show Table for this theorem.

| Know-Show Table |  |  |  |
| :---: | :---: | :---: | :---: |
| $\begin{array}{\|c\|} \hline \text { optional } \\ \text { columns } \end{array}$ |  | mandatory columns |  |
|  |  | Know | Reason |
| 1 | P | $x$ and $y$ are odd integers | Hypothesis |
| 4 | P1 | There exists integers $k_{x}$ and $k_{y}$ such that $x=2 k_{x}+1$ and $y=2 k_{y}+1$ | definition of odd integer |
| 5 | P2 | $x y=\left(2 k_{x}+1\right)\left(2 k_{y}+1\right)$ | substitution |
| 6 | P3 | $x y=4 k_{x} k_{y}+2 k_{x}+2 k_{y}+1$ | algebra |
| 7 | P4 | $x y=2\left(2 k_{x} k_{y}+k_{x}+k_{y}\right)+1$ | algebra |
| 8 | P5 | $\left(2 k_{x} k_{y}+k_{x}+k_{y}\right)$ is an integer | closure properties of the integers |
| 3 | Q1 | There exists an integer $q$ such that $x y=2 q+1$. | use $q=\left(2 k_{x} k_{y}+k_{x}+k_{y}\right)$ |
| 2 | Q | $x \cdot y$ is an odd integer. | definition of odd integer |

Remember, the orderand step columns may vary.
