Quiz for January 12, 2012

The quiz is worth 5 points. Remove EVERYTHING from your desk except this quiz and a pen or pencil.

Suppose a population P of rodents satisfies the differential equation $\frac{dP}{dt} = kP^2$. Initially, there are P(0) = 2 rodents, and their number is increasing at the rate of $\frac{dP}{dt} = 1$ rodent per month when there are P = 10 rodents. How long will it take for this population to grow to a hundred rodents? To a thousand? What is happening here?

ANSWER: We can find k right away. On the one hand, $\frac{dP}{dt} = kP^2$. On the other hand, when P=10, $\frac{dP}{dt}=1$. So $1=\frac{dP}{dt}|_{P=10}=k(10)^2$. We see that $\frac{1}{100}=k$. Now we solve the differential equation:

 $\frac{1}{100} = k \text{. Now we solve the differential equation:}$ $\frac{dP}{dt} = \frac{1}{100}P^2 \text{. Separate the variables } dP/P^2 = (1/100)dt \text{. Integrate both sides:}$ -1/P = (1/100)t + C . Plug in t = 0 to learn: -1/2 = C . We have found -1/P = (1/100)t - (1/2) . Multiply both sides by -100 to get 100/P = -t + 50 or

$$\boxed{\frac{100}{50-t} = P(t)}.$$

We find t with P(t) = 100. So, $\frac{100}{50-t} = 100$ or 1 = 50 - t that is t = 49.

The rodent population hits 100 at t equal to 49 months.

We find t with P(t) = 1000. So, $\frac{100}{50-t} = 1000$ or $\frac{1}{10} = 50-t$ that is $t = 50 - \frac{1}{10}$.

The rodent population hits 100 at t equal to $50 - \frac{1}{10}$ months.

We see that

$$\lim_{t \to 50^{-}} P(t) = \lim_{t \to -50^{-}} \frac{100}{50 - t} = +\infty.$$

The rodent population heads to infinity as t goes to 50 months.
