## Quiz for February 23, 2010

The quiz is worth 5 points. Remove EVERYTHING from your desk except this quiz and a pen or pencil. SHOW every step. Express your work in a neat and coherent manner. BOX your answer.
Solve $\left(x^{2}+1\right) \frac{d y}{d x}+3 x y=6 x$. Express your answer in the form $y(x)$. Check your answer.

ANSWER: This is a first order linear DE:

$$
\frac{d y}{d x}+\frac{3 x}{x^{2}+1} y=\frac{6 x}{x^{2}+1}
$$

The integrating factor is

$$
e^{\int \frac{3 x}{x^{2}+1} d x}=e^{3 / 2 \ln \left(x^{2}+1\right)}=\left(x^{2}+1\right)^{3 / 2}
$$

Multiply both sides by the integrating factor:

$$
\begin{gathered}
\left(x^{2}+1\right)^{3 / 2} \frac{d y}{d x}+3 x\left(x^{2}+1\right)^{1 / 2} y=6 x\left(x^{2}+1\right)^{1 / 2} \\
\frac{d}{d x}\left(\left(x^{2}+1\right)^{3 / 2} y\right)=6 x\left(x^{2}+1\right)^{1 / 2}
\end{gathered}
$$

Integrate both sides:

$$
\begin{gathered}
\left(x^{2}+1\right)^{3 / 2} y=2\left(x^{2}+1\right)^{3 / 2}+C \\
y=2+C\left(x^{2}+1\right)^{-3 / 2}
\end{gathered}
$$

Check. We see that $d y / d x=-(3 / 2) C\left(x^{2}+1\right)^{-5 / 2} 2 x=\frac{-3 C x}{\left(x^{2}+1\right)^{5 / 2}}$. So,

$$
\left(x^{2}+1\right) \frac{d y}{d x}+3 x y=\left(x^{2}+1\right) \frac{-3 C x}{\left(x^{2}+1\right)^{5 / 2}}+3 x\left(2+C\left(x^{2}+1\right)^{-3 / 2}\right)=6 x \checkmark
$$
