## Quiz for April 1, 2010

The quiz is worth 5 points. Remove EVERYTHING from your desk except this quiz and a pen or pencil.

Let  $\varphi: G_1 \to G_2$  and  $\theta: G_2 \to G_3$  be group homomorphisms. Prove that the composition  $\theta \circ \varphi$ , from  $G_1$  to  $G_3$ , is a group homomorphism.

## **ANSWER:**

Let g and g' be elements of  $G_1$ . We compute

$$(\theta \circ \varphi)(gg') = \theta(\varphi(gg')) = \theta(\varphi(g)\varphi(g')) = \theta(\varphi(g))\theta(\varphi(g')) = (\theta \circ \varphi)(g)(\theta \circ \varphi)(g).$$

The first equality is due to the definition of composition. The second equality is due to the hypothesis that  $\varphi$  is a homomorphism. The third equality is due to the hypothesis that  $\theta$  is a homomorphism. The final equality is the definition of composition.
